Listing of the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (original) A method for initializing an equalizer in an Orthogonal Frequency Division Multiplexing (OFDM) receiver, the method comprising the step of:

inhibiting, based at least in part on (a) a first tap of an equalizer being less than a first limit and (b) a time between a first OFDM signal and a second OFDM signal being less than a second limit, an initialization of the first tap.

- 2. (original) The method of claim 1, further comprising the step of: enabling an adaptation of the first tap.
- 3. (original) The method of claim 2, further comprising the step of:
 enabling, based at least in part on a second tap of the equalizer being
 equal to or greater than a third limit, an initialization of the second tap;

wherein the step of enabling the initialization of the second tap is contemporaneous with the step of enabling the adaptation of the first tap.

4. (original) The method of claim 3, further comprising the step of: initializing the second tap;

wherein the step of initializing the second tap includes initializing the second tap based on a training portion of the first OFDM signal.

5. (original) The method of claim 4, further comprising the step of: adapting the first tap;

wherein the step of adapting the first tap includes adapting the first tap based on a data portion of the first OFDM signal.

6. (original) The method of claim 5, wherein the first limit and the third limit are the same.

Ser. No. 09/955,651 PU010233

7. (original) The method of claim 6, further comprising the step of:
receiving at least one of the first OFDM signal and the second OFDM signal over a wireless local area network.

- 8. (original) The method of claim 6, further comprising the step of:
 receiving at least one of the first OFDM signal and the second OFDM
 signal into at least one of a portable computer and a desktop computer.
- 9. (original) A method for initializing an equalizer in an Orthogonal Frequency Division Multiplexing (OFDM) receiver, the method comprising the steps of: initializing a plurality of taps of the equalizer upon startup; re-initializing the plurality of taps upon a passage of a predetermined time between an OFDM signal and a subsequent OFDM signal; and selectively re-initializing at least one of the taps upon a divergence of
- 10. (original) The method of claim 9, wherein:
 the step of initializing includes initializing the plurality of taps based

the tap.

on a training portion of a startup OFDM signal,

the step of re-initializing includes re-initializing the plurality of taps
based on a training portion of the subsequent OFDM signal, and

the step of selectively re-initializing includes selectively re-initializing the at least one of the taps based on a training portion of the OFDM signal.

- 11. (original) The method of claim 10, wherein any one of the steps includes receiving the respective training portion over a wireless local area network.
- 12. (original) The method of claim 10, wherein any one of the steps includes receiving the respective training portion into at least one of a portable computer and a desktop computer.
- 13. (original) An apparatus for initializing equalization operations in an Orthogonal Frequency Division Multiplexing (OFDM) receiver, the apparatus comprising: an equalizer including at least one tap;

Ser. No. 09/955,651 PU010233

a tap initialization controller coupled to the equalizer to set the at least one tap, the tap initialization controller being configured to inhibit, based at least in part on (a) a first tap of the equalizer being less than a first limit and (b) a time between a first OFDM signal and a second OFDM signal being less than a second limit, an initialization of the first tap.

- 14. (original) The apparatus of claim 13, wherein the tap initialization controller is further configured to enable an adaptation of the first tap.
- 15. (original) The apparatus of claim 14, wherein the tap initialization controller is further configured to enable, based at least in part on a second tap of the equalizer being equal to or greater than a third limit, an initialization of the second tap while the tap initialization controller contemporaneously enables the adaptation of the first tap.
- 16. (original) The apparatus of claim 15, wherein the tap initialization controller is further configured to initialize the second tap and is further configured to initialize the second tap based on a training portion of the first OFDM signal.
- 17. (original) The apparatus of claim 16, wherein the tap initialization controller is further configured to adapt the first tap and is further configured to adapt the first tap based on a data portion of the first OFDM signal.
- 18. (original) The apparatus of claim 17, wherein the first limit and the third limit are the same.
- 19. (original) The apparatus of claim 18, further comprising:
- a wireless local area network receiver coupled to the tap initialization controller to provide at least one of the first OFDM signal and the second OFDM signal thereto.
- 20. (original) The apparatus of claim 18, wherein the tap initialization controller is installed in at least one of a portable computer and a desktop computer.

Ser. No. 09/955,651 PU010233

21. (new) A method for initializing an equalizer in an Orthogonal Frequency Division Multiplexing (OFDM) receiver, the method comprising the step of:

inhibiting, based at least in part on (a) a first tap of an equalizer being less than a first limit and (b) a time between a first OFDM signal and a second OFDM signal being less than a second limit, an initialization of the first tap;

enabling an adaptation of the first tap;

limit, an initialization of the first tap;

enabling, based at least in part on a second tap of the equalizer being equal to or greater than the first limit, an initialization of the second tap contemporaneously with the step of enabling the adaptation of the first tap;

initializing the second tap based on a training portion of the first OFDM signal; and

adapting the first tap based on a data portion of the first OFDM signal.

22. (new) An apparatus for initializing equalization operations in an Orthogonal Frequency Division Multiplexing (OFDM) rece iver, the apparatus comprising: an equalizer including at least one tap;

a tap initialization controller coupled to the equalizer to set the at least one tap, the tap initialization controller being configured to inhibit, based at least in part on (a) a first tap of the equalizer being less than a first limit and (b) a time between a first OFDM signal and a second OFDM signal being less than a second

wherein the tap initialization controller is further configured to enable an adaptation of the first tap;

wherein the tap initialization controller is further configured to enable, based at least in part on a second tap of the equalizer being equal to or greater than the first limit, an initialization of the second tap while the tap initialization controller contemporaneously enables the adaptation of the first tap; and

wherein the tap initialization controller is further configured to initialize the second tap based on a training portion of the first OFDM signal and to adapt the first tap based on a data portion of the first OFDM signal.
